
General Description
The LM135 series are precision, easily-calibrated, integrated circuit temperature sensors. Operating as a 2-terminal zener, the LM135 has a breakdown voltage directly proportional to absolute temperature at +10 mV/˚K. With less than 1Ω dynamic impedance the device operates over a current range of 400 µA to 5 mA with virtually no change in performance. When calibrated at 25˚C the LM135 has typically less than 1˚C error over a 100˚C temperature range. Unlike other sensors the LM135 has a linear output. Applications for the LM135 include almost any type of temperature sensing over a −55˚C to +150˚C temperature range. The low impedance and linear output make interfacing to readout or control circuitry especially easy. The LM135 operates over a −55˚C to +150˚C temperature range while the LM235 operates over a −40˚C to +125˚C temperature range. The LM335 operates from −40˚C to +100˚C. The LM135/LM235/LM335 are available packaged in hermetic TO-46 transistor packages while the LM335 is also available in plastic TO-92 packages.

Features
- Directly calibrated in ˚Kelvin
- 1˚C initial accuracy available
- Operates from 400 µA to 5 mA
- Less than 1Ω dynamic impedance
- Easily calibrated
- Wide operating temperature range
- 200˚C overrange
- Low cost

Electrical Characteristics (Note 1) (Continued)

Note 1: Accuracy measurements are made in a well-stirred oil bath. For other conditions, self heating must be considered.

Note 2: Continuous operation at these temperatures for 10,000 hours for H package and 5,000 hours for Z package may decrease life expectancy of the device.

Note 3:
- Thermal Resistance
  - TO-92: $202^\circ$C/W
  - TO-46: $400^\circ$C/W
  - SO-8: $165^\circ$C/W
- $\theta_{JC}$ (junction to case)
  - TO-92: $170^\circ$C/W
  - TO-46: N/A
  - SO-8: N/A

Note 4: Refer to RETS135H for military specifications.

**Application Hints**

**CALIBRATING THE LM135**

Included on the LM135 chip is an easy method of calibrating the device for higher accuracies. A pot connected across the LM135 with the arm tied to the adjustment terminal allows a 1-point calibration of the sensor that corrects for inaccuracy over the full temperature range.

This single point calibration works because the output of the LM135 is proportional to absolute temperature with the extrapolated output of sensor going to 0V output at 0˚K (−273.15˚C). Errors in output voltage versus temperature are only slope (or scale factor) errors so a slope calibration at one temperature corrects at all temperatures.

The output of the device (calibrated or uncalibrated) can be expressed as:

\[ V_{OUT_T} = V_{OUT_{T_0}} \times \frac{T}{T_0} \]

where \( T \) is the unknown temperature and \( T_0 \) is a reference temperature, both expressed in degrees Kelvin. By calibrating the output to read correctly at one temperature the output at all temperatures is correct. Nominally the output is calibrated at 10 mV/˚K.

**Typical Applications**

**Basic Temperature Sensor**

![Basic Temperature Sensor Diagram](DS005698-2)

**Calibrated Sensor**

![Calibrated Sensor Diagram](DS005698-9)

*Calibrate for 2.982V at 25˚C

**Wide Operating Supply**

![Wide Operating Supply Diagram](DS005698-10)

To insure good sensing accuracy several precautions must be taken. Like any temperature sensing device, self heating can reduce accuracy. The LM135 should be operated at the lowest current suitable for the application. Sufficient current, of course, must be available to drive both the sensor and the calibration pot at the maximum operating temperature as well as any external loads.

If the sensor is used in an ambient where the thermal resistance is constant, self heating errors can be calibrated out. This is possible if the device is run with a temperature stable current. Heating will then be proportional to zener voltage and therefore temperature. This makes the self heating error proportional to absolute temperature the same as scale factor errors.

**WATERPROOFING SENSORS**

Meltable inner core heat shrinkable tubing such as manufactured by Raychem can be used to make low-cost waterproof sensors. The LM335 is inserted into the tubing about 1/2” from the end and the tubing heated above the melting point of the core. The unfilled 1/2" end melts and provides a seal over the device.

*For IR = 0.5 mA, the trim pot must be deleted.

Isolated Temperature Sensor
Typical Applications (Continued)

Simple Temperature Controller

- Set R1 for 2.554V across LM336.
- Adjust R2 for correct output.

Simple Temperature Control

- Set R1 for 2.7315V at output of LM308.

Ground Referred Fahrenheit Thermometer

- Adjust R2 for 2.554V across LM336.
- Adjust R1 for correct output.

Centigrade Thermometer

- Adjust for 2.7315V at output of LM308.

www.national.com
**Typical Applications (Continued)**

**Fahrenheit Thermometer**

*To calibrate, adjust R2 for 2.554V across LM336. Adjust R1 for correct output.*

**THERMOCOUPLE COLD JUNCTION COMPENSATION**

*Select R3 for proper thermocouple type

**THERMO-**

Adjustments:
1. Adjust R1 for the voltage across R3 equal to the Seebeck Coefficient times ambient temperature in degrees Kelvin.
2. Adjust R2 for voltage across R4 corresponding to thermocouple

- J 14.32 mV
- T 11.79 mV
- K 11.17 mV
- S 1.768 mV
Terminates thermocouple reference junction in close proximity to LM335.

Adjustments:
1. Apply signal in place of thermocouple and adjust R3 for a gain of 245.7.
2. Short non-inverting input of LM308A and output of LM329B to ground.
3. Adjust R1 so that $V_{OUT} = 2.982V$ @ 25°C.
4. Remove short across LM329B and adjust R2 so that $V_{OUT} = 246 mV$ @ 25°C.
5. Remove short across thermocouple.

Fast Charger for Nickel-Cadmium Batteries

Adjust D1 to 50 mV greater $V_2$ than D2.
Charge terminates on 5°C temperature rise. Couple D2 to battery.

Typical Applications (Continued)

**Definition of Terms**

**Operating Output Voltage:** The voltage appearing across the positive and negative terminals of the device at specified conditions of operating temperature and current.

**Uncalibrated Temperature Error:** The error between the operating output voltage at 10 mV/˚K and case temperature at specified conditions of current and case temperature.

**Calibrated Temperature Error:** The error between operating output voltage and case temperature at 10 mV/˚K over a temperature range at a specified operating current with the 25˚C error adjusted to zero.

**Air Flow Detector**

*Self heating is used to detect air flow*
LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.

2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.

National does not assume any responsibility for use of any circuitry described, no circuit patent licenses are implied and National reserves the right at any time without notice to change said circuitry and specifications.
